

# WYNN Stock Analysis with Panel

Massimo Prag  
Northeastern University

a) A screen shot of your dashboard

b) The dashboard we created is used to analyze WYNN stock price over specified periods of time. We also perform studies on the data through Moving Averages which we can adjust. This is useful with finding certain points where the price might be higher than average and we can determine that denominator using length. We can also see the relationship between volume which is the amount of stock bought or sold and price. When price increases but volume does not vwap keeps a stable level to also hint that the price is too high. Using a dashboard is extremely important because of how easy it is to add, remove or adjust studies.
